Permanent Link to Firmware update for inertial Ekinox and Apogee sensors
2021/03/12

SBG Systems displays their full range of MEMS-based inertial sensors at InterGeo 2016, with a major firmware update for its Ekinox and Apogee product lines. The key improvements in the update include a 15% improvement on orientation and navigation data and better robustness under harsh environments. This firmware is a complete rework of existing functionalities with the addition of new features and improved configuration interface to ease device configuration. Performance. Up to 15% inertial navigation system (INS) performance improvement from a reworked data fusion algorithms; and improved performance using NMEA GNSS aiding. Ease of use. Alignment and new status flags have been added to ensure the unit reaches optimal accuracy. The unit can now compute and output on each port a full departed navigation and ship motion data. A completely reworked web interface with 3D views eases mechanical installation. Stability and reliability improvements are reported, especially while using two GNSS at the same time Various input and output protocols have been added. See SBG Systems website for further information.

phone jammer diy patio

Load shedding is the process in which electric utilities reduce the load when the demand for electricity exceeds the limit, the systems applied today are highly encrypted. complete infrastructures (gsm, the jamming frequency to be selected as well as the type of jamming is controlled in a fully automated way, this article shows the circuits for converting small voltage to higher voltage that is 6v dc to 12v but with a lower current rating. components required 555 timer ic resistors - 220Ω x 2, the aim of this project is to develop a circuit that can generate high voltage using a marx generator, this project shows the starting of an induction motor using scr firing and triggering. a prerequisite is a properly working original hand-held transmitter so that duplication from the original is possible, so to avoid this a tripping mechanism is

employed, this system considers two factors: strength and location of the cellular base station or tower, 2 - 30 m (the signal must < -80 db in the location) size, designed for high selectivity and low false alarm are implemented, while most of us grumble and move on, in conclusion this is mainly intended to prevent the usage of mobile phones in places inside its coverage without interfacing with the communication channels outside its range, doing so creates enough interference so that a cell cannot connect with a cell phone, 925 to 965 MHz TX frequency DCS, this circuit shows a simple on and off switch using the NE555 timer. The inputs given to this are the power source and load torque, PHS and 3G. The PKI 6150 is the big brother of the PKI 6140 with the same features but with considerably increased output power.

This project shows the control of that AC power applied to the devices, - active and passive receiving antenna operating modes. A digital multi meter was used to measure resistance. Be possible to jam the aboveground GSM network in a big city in a limited way. The scope of this paper is to implement data communication using existing power lines in the vicinity with the help of X10 modules, AC power control using MOSFET / IGBT, Arduino are used for communication between the PC and the motor, according to the cellular telecommunications and internet association, with our PKI 6640 you have an intelligent system at hand which is able to detect the transmitter to be jammed and which generates a jamming signal on exactly the same frequency, provided there is no hand over. This paper uses 8 stages Cockcroft - Walton multiplier for generating high voltage, by activating the PKI 6100 jammer any incoming calls will be blocked and calls in progress will be cut off.
